# Multihoming

Supporting **IPv6 host-based multihoming** (shim6) in Linux Firewalls

# Multihoming

Supporting **IPv6 host-based multihoming** (shim6) in Linux Firewalls

# Multihoming

Supporting **IPv6 host-based multihoming** (shim6) in Linux Firewalls

## Shim6

Supporting IPv6 host-based multihoming (**shim6**) in Linux Firewalls

# Shim6

## Supporting IPv6 host-based multihoming (**shim6**) in Linux Firewalls

## Shim6

Supporting IPv6 host-based multihoming (**shim6**) in Linux Firewalls

## Shim6

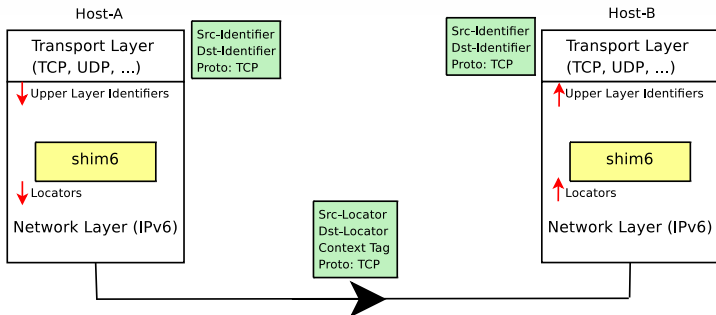

Supporting IPv6 host-based multihoming (**shim6**) in Linux Firewalls

# Shim6

Separate Locators from Identifiers.

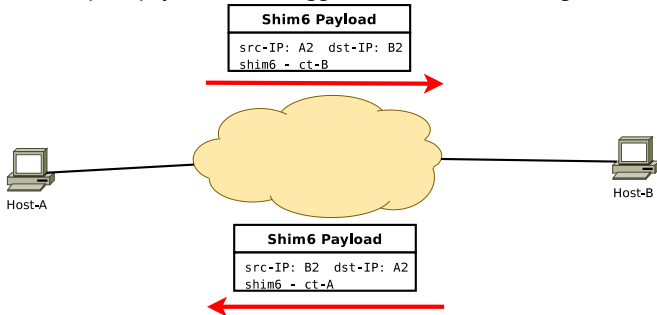

**Identifier** Identifies a connection and is passed to the upper layer protocols.

**Locators** Used inside the packet.

# Shim6

- Shim6 control messages
  - Establish the shim6 session
  - Assure connectivity
  - Switch locators
- Shim6 payload messages
  - Transport payload-data, tagged with the context tag

# Statefull firewall

Supporting IPv6 host-based multihoming(shim6) in **Linux Firewalls**

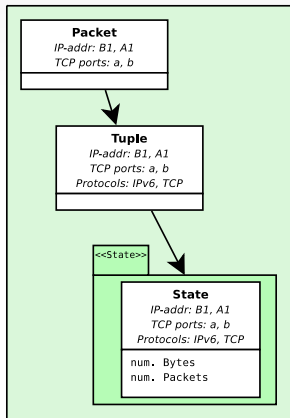

# Statefull firewall

## Supporting IPv6 host-based multihoming(shim6) in **Linux Firewalls**

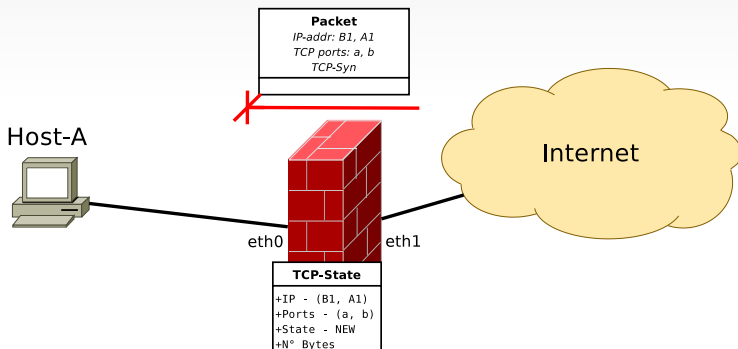

# Statefull firewall

## Supporting IPv6 host-based multihoming(shim6) in **Linux** Firewalls

# Statefull firewall

## Supporting IPv6 host-based multihoming(shim6) in **Linux Firewalls**

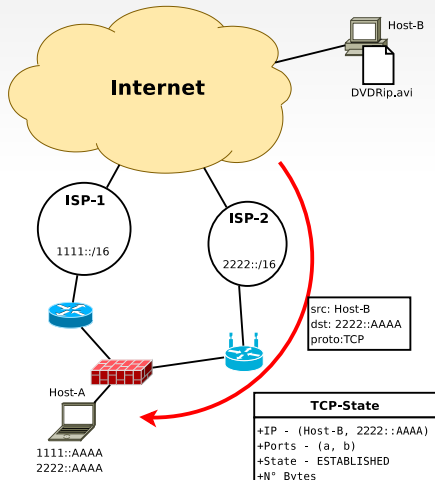

```
iptables -i eth1 --state NEW -j DROP
```

- 1 Theoretic overview

  - Shim6-firewall architecture
- 4 Performance evaluation
- 5 Configuring a shim6-firewall
- 6 Conclusion

# Shim6 vs. Stateful Firewalls

# Shim6 vs. Stateful Firewalls

# Solution

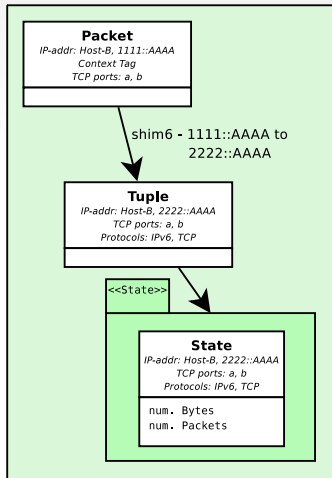

- Associate the new flow to the original state
- Track shim6 context establishment
- Map Context Tag to the pair of identifiers

## Problems

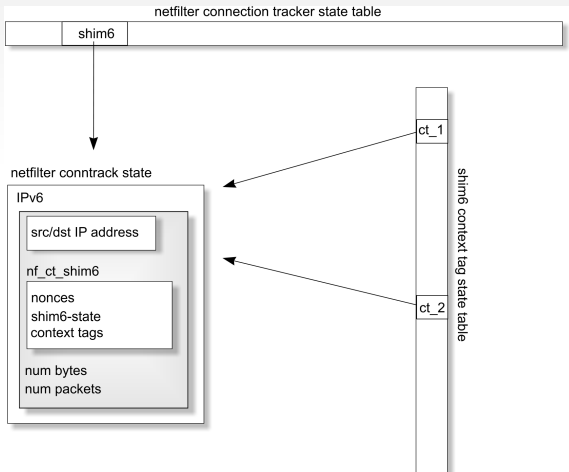

Shim6 does not allow support of each feature in stateful firewalls.  
Shim6 needs to be changed.

- 1 Theoretic overview
  - Multihoming
  - Shim6
  - Statefull firewall
- 2 Shim6 and Firewalls: Problem statement
  - Design of the shim6 firewall
- 3 **Implementation**
  - **Shim6-firewall architecture**
- 4 Performance evaluation
- 5 Configuring a shim6-firewall
- 6 Conclusion

# Shim6-Firewall architecture

# Shim6-Firewall architecture

- 1 Theoretic overview

  - Shim6
  - Statefull firewall
- 2 Shim6 and Firewalls: Problem statement
  - Design of the shim6 firewall
- 3 Implementation
  - Shim6-firewall architecture
- 4 Performance evaluation
- 5 Configuring a shim6-firewall
- 6 Conclusion

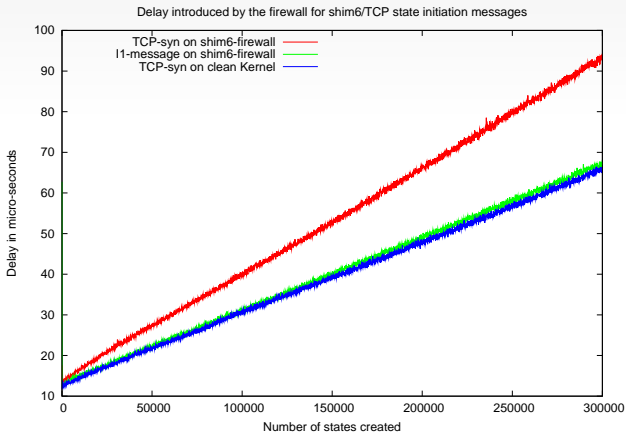

## Test Setup

- Creation of a huge number of firewall-states
- Delay measured that the firewall introduces

# Session Initiation messages

- 1 Theoretic overview
  - Multihoming
  - Shim6
  - Statefull firewall
- 2 Shim6 and Firewalls: Problem statement
  - Design of the shim6 firewall
- 3 Implementation
  - Shim6-firewall architecture
- 4 Performance evaluation
- 5 Configuring a shim6-firewall**
- 6 Conclusion

## Express consistent rules

- Filter on identifiers rather than on locators.
- Avoid locator-specific rules.
- Avoid per-locators rate-limiting rules.

- 1 Theoretic overview
  - Multihoming
  - Shim6
  - Statefull firewall
- 2 Shim6 and Firewalls: Problem statement
  - Design of the shim6 firewall
- 3 Implementation
  - Shim6-firewall architecture
- 4 Performance evaluation
- 5 Configuring a shim6-firewall
- 6 **Conclusion**

# Conclusion

- Most parts of shim6 are supported in the Linux firewall.
- Performs very well even with a huge number of states.
- Configuring the firewall needs to be done carefully.

## Future Work

- Minor modifications to the shim6 protocol.
- Adapt firewall to these changes.
- Tweak the firewall to achieve best performance.

# Questions?
